

# Lecture 12: Lower Bound for Sorting, Countingsort, Radixsort

COMS10007 - Algorithms

Dr. Christian Konrad

11.03.2020

# Can we sort faster than $O(n \log n)$ time?

**Recall:** Fastest runtime of any sorting algorithm seen is  $O(n \log n)$

## Can we sort faster?

- For example in  $O(n \log \log n)$  time?
- Or even  $O(n)$  time?

**Yes!** we can sometimes sort faster

But in general, **no**, we cannot

**Example:** Sort an array of length  $n$  of bits, i.e., every array element is either 0 or 1, in time  $O(n)$ ?

- Count number of 0s  $n_0$
- Write  $n_0$  0s followed by  $n - n_0$  1s
- Both operations take time  $O(n)$

## Comparison-based Sorting

- Order is determined solely by comparing input elements
- All information we obtain is by asking “Is  $A[i] \leq A[j]$ ?”, for some  $i, j$ , in particular, we may not inspect the elements
- Quicksort, mergesort, insertionsort, heapsort are comparison-based sorting algorithms

## Lower Bound for Comparison-based Sorting

- We will prove that every comparison-based sorting algorithm requires  $\Omega(n \log n)$  comparisons
- This implies that  $O(n \log n)$  is an optimal runtime for comparison-based sorting

# Lower Bound for Comparison-based Sorting

## Problem

- $A$  : array of length  $n$ , all elements are different
- We are only allowed to ask: Is  $A[i] < A[j]$ , for any  $i, j \in [n]$
- How many questions are needed until we can determine the order of all elements?

## Permutations

- A *bijective* function  $\pi : [n] \rightarrow [n]$  is called a permutation

- A reordering of  $[n]$

# Lower Bound for Comparison-based Sorting (2)

## How many permutations are there?

Let  $\Pi$  be the set of all permutations on  $n$  elements

### Lemma

$$|\Pi| = n! = n \cdot (n-1) \dots 3 \cdot 2 \cdot 1$$

**Proof.** The first element can be mapped to  $n$  potential elements. The second can only be mapped to  $(n-1)$  elements. etc.  $\square$

**Rephrasing our Task:** Find permutation  $\pi \in \Pi$  such that:

$$A[\pi(1)] < A[\pi(2)] < \dots < A[\pi(n-1)] < A[\pi(n)]$$

# Decision-tree Model

## Example:

Sort 3 elements by asking queries:  $A[i] < A[j]$ , for  $i, j \in [3]$

**How many Queries are needed?** (worst case)

### Lemma

*At least 3 queries are needed to sort 3 elements.*

**Proof.** Let the three elements be  $a, b, c$ . Suppose that the first query is  $a < b$  and suppose that the answer is yes. (if it is not then relabel the elements  $a, b, c$ ). We are left with 3 scenarios:

$$1. a < b < c \quad 2. a < c < b \quad 3. c < a < b$$

Next we either ask  $a < c$  or  $b < c$ . Suppose that we ask  $a < c$ . Then, if the answer is yes then we are left with cases 1 and 2 and we need an additional query. Suppose that we ask  $b < c$ . Then, if the answer is no then we are left with cases 2 and 3 and we need an additional query. □

# Decision-tree Model (2)

## Every Guessing Strategy is a Decision-tree

### Observe:

- Every leaf is a permutation
- An execution is a root-to-leaf path

# Decision-tree Model (2)

## Every Guessing Strategy is a Decision-tree

### Observe:

- Every leaf is a permutation
- An execution is a root-to-leaf path

# Sorting Lower Bound

## Lemma

*Any comparison-based sorting algorithm requires  $\Omega(n \log n)$  comparisons.*

**Proof** Observe that decision-tree is a binary tree. Every potential permutation is a leaf. There are  $n!$  leaves. A binary tree of height  $h$  has no more than  $2^h$  leaves. Hence:

$$\begin{aligned} 2^h &\geq n! \\ h &\geq \log(n!) = \Omega(n \log n) . \end{aligned}$$

**Comment:** Stirling's approximation for  $n!$  can be used for proving  $\log(n!) = \Omega(n \log n)$

# Counting Sort: Sorting Integers fast

## Counting Sort

Input is an array  $A$  of integers from  $\{0, 1, 2, \dots, k\}$ , for some integer  $k$

## Idea

- For each element  $x$ , count number of elements  $< x$
- Put  $x$  directly into its position
- **Difficulty:** Multiple elements have the same value

# Algorithm

**Require:** Array  $A$  of  $n$  integers from  $\{0, 1, 2, \dots, k\}$ , for some integer  $k$

Let  $C[0 \dots k]$  be a new array with all entries equal to 0

Store output in array  $B[0 \dots n - 1]$

**for**  $i = 0, \dots, n - 1$  **do** {Count how often each element appears}

$C[A[i]] \leftarrow C[A[i]] + 1$

**for**  $i = 1, \dots, k$  **do** {Count how many smaller elements appear}

$C[i] \leftarrow C[i] + C[i - 1]$

**for**  $i = n - 1, \dots, 0$  **do**

$B[C[A[i]] - 1] \leftarrow A[i]$

$C[A[i]] \leftarrow C[A[i]] - 1$

**return**  $B$

- Last loop processes  $A$  from right to left
- $C[A[i]]$ : Number of *smaller* elements than  $A[i]$
- Decrementing  $C[A[i]]$ : Next element of value  $A[i]$  should be left of the current one

# Counting Sort: Example

**Example:**  $n = 8$ ,  $k = 5$

|   | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
|---|---|---|---|---|---|---|---|---|
| A | 2 | 5 | 3 | 0 | 2 | 3 | 0 | 3 |

# Counting Sort: Example

**Example:**  $n = 8$ ,  $k = 5$

|     |   |   |   |   |   |   |   |   |
|-----|---|---|---|---|---|---|---|---|
|     | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| $A$ | 2 | 5 | 3 | 0 | 2 | 3 | 0 | 3 |

|     |   |   |   |   |   |   |
|-----|---|---|---|---|---|---|
|     | 0 | 1 | 2 | 3 | 4 | 5 |
| $C$ | 2 | 0 | 2 | 3 | 0 | 1 |

# Counting Sort: Example

**Example:**  $n = 8$ ,  $k = 5$

|          |   |   |   |   |   |   |   |   |
|----------|---|---|---|---|---|---|---|---|
|          | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| <i>A</i> | 2 | 5 | 3 | 0 | 2 | 3 | 0 | 3 |

|          |   |   |   |   |   |   |
|----------|---|---|---|---|---|---|
|          | 0 | 1 | 2 | 3 | 4 | 5 |
| <i>C</i> | 2 | 0 | 2 | 3 | 0 | 1 |

|          |   |   |   |   |   |   |
|----------|---|---|---|---|---|---|
|          | 0 | 1 | 2 | 3 | 4 | 5 |
| <i>C</i> | 2 | 2 | 4 | 7 | 7 | 8 |

|          |   |   |   |   |   |   |   |   |
|----------|---|---|---|---|---|---|---|---|
|          | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| <i>B</i> |   |   |   |   |   |   |   |   |

```
for  $i = n - 1, \dots, 0$  do  
     $B[C[A[i]] - 1] \leftarrow A[i]$   
     $C[A[i]] \leftarrow C[A[i]] - 1$ 
```

# Counting Sort: Example

**Example:**  $n = 8$ ,  $k = 5$

|   |   |   |   |   |   |   |   |   |
|---|---|---|---|---|---|---|---|---|
|   | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| A | 2 | 5 | 3 | 0 | 2 | 3 | 0 | 3 |

|   |   |   |   |   |   |   |
|---|---|---|---|---|---|---|
|   | 0 | 1 | 2 | 3 | 4 | 5 |
| C | 2 | 0 | 2 | 3 | 0 | 1 |

|   |   |   |   |   |   |   |
|---|---|---|---|---|---|---|
|   | 0 | 1 | 2 | 3 | 4 | 5 |
| C | 2 | 2 | 4 | 7 | 7 | 8 |

|   |   |   |   |   |   |   |   |   |
|---|---|---|---|---|---|---|---|---|
|   | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| B |   |   |   |   |   |   | 3 |   |

```
for  $i = n - 1, \dots, 0$  do  
     $B[C[A[i]] - 1] \leftarrow A[i]$   
     $C[A[i]] \leftarrow C[A[i]] - 1$ 
```

# Counting Sort: Example

**Example:**  $n = 8$ ,  $k = 5$

|   |   |   |   |   |   |   |   |   |
|---|---|---|---|---|---|---|---|---|
|   | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| A | 2 | 5 | 3 | 0 | 2 | 3 | 0 | 3 |

|   |   |   |   |   |   |   |
|---|---|---|---|---|---|---|
|   | 0 | 1 | 2 | 3 | 4 | 5 |
| C | 2 | 0 | 2 | 3 | 0 | 1 |

|   |   |   |   |   |   |   |
|---|---|---|---|---|---|---|
|   | 0 | 1 | 2 | 3 | 4 | 5 |
| C | 2 | 2 | 4 | 6 | 7 | 8 |

|   |   |   |   |   |   |   |   |   |
|---|---|---|---|---|---|---|---|---|
|   | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| B |   |   |   |   |   |   | 3 |   |

```
for  $i = n - 1, \dots, 0$  do  
     $B[C[A[i]] - 1] \leftarrow A[i]$   
     $C[A[i]] \leftarrow C[A[i]] - 1$ 
```

# Counting Sort: Example

**Example:**  $n = 8$ ,  $k = 5$

|   |   |   |   |   |   |   |   |   |
|---|---|---|---|---|---|---|---|---|
|   | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| A | 2 | 5 | 3 | 0 | 2 | 3 | 0 | 3 |

|   |   |   |   |   |   |   |
|---|---|---|---|---|---|---|

     $B[C[A[i]] - 1] \leftarrow A[i]$   
     $C[A[i]] \leftarrow C[A[i]] - 1$ 
```

# Analysis: Counting Sort

## Runtime:

$$O(n) + O(k) + O(n) = O(n + k)$$

- Counting Sort has runtime  $O(n)$  if  $k = O(n)$
- This beats the lower bound for comparison-based sorting

```
for  $i = 0, \dots, n-1$  do  
     $C[A[i]] \leftarrow C[A[i]] + 1$   
for  $i = 1, \dots, k$  do  
     $C[i] \leftarrow C[i] + C[i-1]$   
for  $i = n-1, \dots, 0$  do  
     $B[C[A[i]] - 1] \leftarrow A[i]$   
     $C[A[i]] \leftarrow C[A[i]] - 1$ 
```

**Stable? In-place?** Yes, it is stable (important!) No, not in-place

**Correctness** Loop Invariant
